RAIL GUARDS

MANTA Rail Guards are made of an extremely tactile, rubber like material that resist the transfer of heat to your hand while reducing mirage from a hot barrel during sustained or automatic fire. An internal stainless steel skeleton provides adjustability to increase grip tension onto the rail and guards can be cut to length for a custom fit. Simply snap the guards anywhere on a rail in seconds and create a hardwearing rail grip interface that is not affected by extreme heat, environment, chemicals or abrasion.
